Tells the switch when to delete an entry Note: a timestamp is included in each entry, and each entry can stay in the table for only a certain amount of time unless the timestamp is updated. So when a switch first sees a source MAC address, it creates the switching table entry...both input (when files are read from the drive) and output (when files are written to the drive). Network cards can perform all three functions. A network card is an output device when data is sent from the computer to the network and an input device when data comes from the network to the computer.
